

Ionic4.x Javascript 扩展 Modal 以及 Modal 传值

主讲教师: (大地)

我的专栏: https://www.itying.com/category-79-b0.html

合作网站: www.ionic.wang (Ionic 中文网)

1、	Modal 模态对话框简介	1
	Modal 模态对话框使用	
3、	Modal 页面给弹出的组件传值	4
4、	弹出的组件关闭的时候给 modal 页面传值	5

1、Modal 模态对话框简介

官方文档: https://ionicframework.com/docs/api/modal

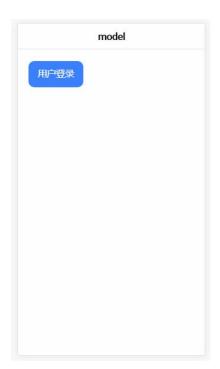

Modal 模态对话框主要用于登录注册页面,我们可以把它理解为从页面底部弹出的另一个页面。

2、Modal 模态对话框使用

比如我们想在 modal 页面中弹出另一个页面

1、新建一个 model 页面以及在 model 页面下面新建一个组件。

```
D:\ionic4x_release\ionicdemo04>ionic g page model
> ng generate page model
CREATE src/app/model/model.module.ts (538 bytes)
CREATE src/app/model/model.page.html (132 bytes)
CREATE src/app/model/model.page.spec.ts (684 bytes)
CREATE src/app/model/model.page.ts (252 bytes)
CREATE src/app/model/model.page.scss (0 bytes)
UPDATE src/app/app-routing.module.ts (953 bytes)
[OK] Generated page!
```

```
D:\ionic4x_release\ionicdemo04>ionic g component model/components/login
> ng generate component model/components/login
CREATE src/app/model/components/login/login.component.html (24 bytes)
CREATE src/app/model/components/login/login.component.spec.ts (684 bytes)
CREATE src/app/model/components/login/login.component.ts (264 bytes)
CREATE src/app/model/components/login/login.component.scss (0 bytes)
[OK] Generated component!
```

2、在 model 页面所在的模块中引入刚才创建的 login 组件,并声明

```
import { LoginComponent} from './components/login/login.component';
```

```
@NgModule({
   imports: [
     CommonModule,
     FormsModule,
     IonicModule,
     RouterModule.forChild(routes)
   ],
   declarations: [ModelPage,LoginComponent],
   entryComponents: [LoginComponent]
})
```

3、在 modal 页面中引入刚才创建的 login 组件,并且引入 ModalController 弹出模态对话框, 代码如下:

```
import { Component, OnInit } from '@angular/core';
import { ModalController } from '@ionic/angular';
import { LoginComponent } from '../components/login/login.component';
@Component({
  selector: 'app-modal',
  templateUrl: './modal.page.html',
  styleUrls: ['./modal.page.scss'],
})
export class ModalPage implements OnInit {
  constructor(public modalController: ModalController) {}
  ngOnInit() {
  async presentModal() {
    const modal = await this.modalController.create({
       showBackdrop:true,
       component: LoginComponent,
       componentProps: { value: 123 }
    return await modal.present();
  }
}
```

3、Modal 页面给弹出的组件传值

1、modal 页面在 componentProps 中给弹出的组件页面传值

2、弹出的组件页面通过 NavParams 接受 modal 页面的传值

```
import { Component, OnInit,Input } from '@angular/core';
import { NavParams } from '@ionic/angular';
@Component({
  selector: 'app-login',
  templateUrl: './login.component.html',
  styleUrls: ['./login.component.scss'],
})
export class LoginComponent implements OnInit {
  @Input() aid: any;
  constructor(public navParams: NavParams) {
    // componentProps can also be accessed at construction time using NavParamsns
    console.log(this.navParams);
  }
  ngOnInit() {
  closeModel(){
    this.navParams.data.modal.dismiss({
       'result': '消失的时候返回的内容'
    });
  }
```

4、弹出的组件关闭的时候给 modal 页面传值

1、modal 监听关闭事件

```
async showModel(){
    const modal = await this.modalController.create({
        component: LoginComponent,
        componentProps: { aid: '123' }
    });
    await modal.present();
    //监听销毁的事件
    const { data } = await modal.onDidDismiss();
    console.log(data);
}
```

2、Login 组件关闭的时候传入数据

```
closeModel(){
    this.navParams.data.modal.dismiss({
        'result': '消失的时候返回的内容'
    });
}
```

Login 组件完整代码:

```
import { Component, OnInit,Input } from '@angular/core';
import { NavParams } from '@ionic/angular';
@Component({
    selector: 'app-login',
    templateUrl: './login.component.html',
    styleUrls: ['./login.component.scss'],
})
export class LoginComponent implements OnInit {
    @Input() aid: any;
    constructor(public navParams: NavParams) {
        // componentProps can also be accessed at construction time using NavParamsns
```

```
console.log(this.navParams);
}

ngOnInit() {

}
closeModel(){
  this.navParams.data.modal.dismiss({
    'result': '消失的时候返回的内容'
  });
}
```
